Generic "toy" questions

Some generic questions that may interest intellectual historians:

- Concept prevalence: how prevalent is concept X?
- Concept association: which concepts are typically associated with X?
- Topic discovery: which topics are frequently discussed?
- Topic prevalence: is there a correlation between the prevalence of different topics?

Intellectual historians typically assess such questions qualitatively.

I will illustrate how to approach them quantitatively.

Test corpus

- Sample of 324 philosophical articles from 1930-2010:
  - The Journal of Philosophy: 118 articles
  - The Philosophical Review: 206 articles

- Subcorpora:
  - 1930s: 38 articles
  - 1940s: 37 articles
  - ⋮
  - 2010s: 53 articles

Prevalence of "truth-like" concepts (1)

272   ass.words[[i]] <- ass.words[[i]]$myword[1:n]}
273
```

Topic discovery (1)

Topic models are algorithms that allow us to identify hidden thematic patterns in (sets of) texts.

- A topic is treated as a distribution over words.
- A document is treated as a distribution over topics.
